Spatial data

- What are spatial data?
- Why spatial data?

"A major pleasure in working with spatial data is their visualization. Maps are amongst the most compelling graphics, because the space they map is the space we think we live in, and maps can show things we cannot see otherwise". Roger Bivand, Edzer Pebesma, Virgilio Gomez-Rubio, Applied Spatial Data Analysis with R, Use R!, Springer 2008."

- Types of spatial data:
 - 1. Geostatistical data.
 - 2. Lattice data.
 - 3. Point pattern data.

- Geostatistical data.
 - 1. Identify the variable(s) of interest (e.g. concentration of ozone, amount of rainfall, temperature, elevation, etc.)
 - 2. Know the coordinates (x, y) of the data points.
 - 3. Plot the data points on a map.
 - 4. Construct a bubble plot.
 - 5. Plot the variable(s) of interest against x and against y. Why?
 - 6. Predict the variable(s) of interest at unsampled locations.
- Example 1: California ozone data.

```
a <- read.table("http://www.stat.ucla.edu/~nchristo/maadmeg/
ozone.txt", header=TRUE)
```

#Load the package "maps": library(maps)

#We can display the data points and the map using the following commands: plot(a\$x, a\$y, xlim=c(-125,-114),ylim=c(32,43), xlab="Longitude", ylab="Latitude", main="Ozone locations in California")

Ozone monitoring stations in California

```
#Add the map of California:
map("county", "ca",add=TRUE)
```

#We can also plot the points relative to their value #(larger values will be displayed with larger circles) plot(a\$x, a\$y, xlim=c(-125,-114),ylim=c(32,43), xlab="Longitude", ylab="Latitude", main="Ozone locations in California", "n")

map("county", "ca",add=TRUE)

#Use cex argument to construct the bubble plot: points(a\$x, a\$y, cex=a\$o3/mean(a\$o3))

Bubble plot of ozone in California

• Example 2: Exploring spatial correlation.

An *h*-scatterplot shows all possible pairs of data values whose locations are separated by a certain distance in a particular direction. For example, the figure below shows a 10×10 grid (100 data points - with distance between two consecutive data points 1 *m* in north-south and east-west direction).

| • | • | • | ٠ | ٠ | ٠ | ٠ | ٠ | ٠ | • |
|---|---|---|---|---|---|---|---|---|---|
| • | ٠ | ٠ | • | • | • | • | • | • | • |
| • | • | ٠ | ٠ | ٠ | ٠ | ٠ | ٠ | ٠ | ٠ |
| • | • | ٠ | ٠ | ٠ | ٠ | ٠ | ٠ | ٠ | ٠ |
| • | ٠ | ٠ | • | • | • | • | • | • | • |
| • | ٠ | ٠ | • | • | • | • | • | • | • |
| • | • | • | • | • | • | • | • | • | • |
| • | ٠ | ٠ | ٠ | • | • | ٠ | • | ٠ | • |
| • | • | ٠ | ٠ | ٠ | ٠ | ٠ | ٠ | ٠ | • |
| • | • | • | • | • | • | • | • | • | • |

And below we see the value at each location.

| 81 | 77 | 103 | 112 | 123 | 19 | 40 | 111 | 114 | 120 |
|----|-----|-----|-----|-----|-----|----|-----|-----|-----|
| 82 | 61 | 110 | 121 | 119 | 77 | 52 | 111 | 117 | 124 |
| 82 | 74 | 97 | 105 | 112 | 91 | 73 | 115 | 118 | 129 |
| 88 | 70 | 103 | 111 | 122 | 64 | 84 | 105 | 113 | 123 |
| 89 | 88 | 94 | 110 | 116 | 108 | 73 | 107 | 118 | 127 |
| 77 | 82 | 86 | 101 | 109 | 113 | 79 | 102 | 120 | 121 |
| 74 | 80 | 85 | 90 | 96 | 101 | 96 | 72 | 128 | 130 |
| 75 | 80 | 83 | 87 | 94 | 99 | 95 | 48 | 139 | 145 |
| 77 | 84 | 74 | 108 | 121 | 143 | 91 | 52 | 136 | 144 |
| 87 | 100 | 47 | 111 | 124 | 109 | 0 | 98 | 134 | 144 |

In this first example we will plot each value (we place it on the x-axis) against a value that is 1 m apart on the south-north direction (we place it on the y-axis). How many pairs are there? The scatterplot shows a cloud of points distributed around the 45-degree line. We observe that there is an association between nearby data points. If we increase the distance from 1 m to 2 m, 3 m, and 4 m we see that the cloud becomes "fatter" indicating that the values separated by longer distance are not as correlated as with the 1 m case. These plots are shown below:

Similarly, if we move on southwest-northeast direction we will pair all values that are $\sqrt{2} m$ apart. How many pairs are there?

• As with many graphical displays, we need a quantitative summary of the information contained on an *h*-scatterplot. We want to know the strength of the association between points separated by distance *h*. We therefore compute the covariance and the correlation. The table below show the values of the covariance and correlation for separation distances h = 1, 2, 3, 4 on the south-north direction

| h | C(h) | ho(h) |
|---|-------|-------|
| 1 | 453.4 | 0.742 |
| 2 | 345.1 | 0.590 |
| 3 | 327.8 | 0.560 |
| 4 | 295.2 | 0.476 |

The plot of the correlation coefficient $(\rho(h))$ against h (the separation distance) it is called *correlogram*. We can also plot the covariance (C(h)) against h to get the so called *covariogram*.

• The two figures below show the covariogram and correlogram for these data.
