Homework 10

**EXERCISE 1**

A coin is thrown independently 10 times to test that the probability of heads is  $\frac{1}{2}$  against the alternative that the probability is not  $\frac{1}{2}$ . The test rejects  $H_0$  if either 0 or 10 heads are observed.

- a. What is the significance level  $\alpha$  of the test?
- b. If in fact the probability of heads is 0.1, what is the power of the test?

**EXERCISE 2**

The output voltage of a certain electric circuit is specified to be 130 volts. The population standard deviation is known to be  $\sigma = 3.0$  volts. A sample of 40 readings on the voltage of this circuit gave a sample mean of 128.6 volts.

- a. Test the hypothesis that the mean output voltage is 130 volts against the alternative that it is less than 130 volts. Use  $\alpha = 0.05$ .
- b. Based on your answer to (a), is it possible that the mean output voltage is still 130 volts? Explain.
- c. If the true population mean output voltage is 128.6 volts, compute the probability of a type II error ( $\beta$ ) and the power of the test ( $1 - \beta$ ) when  $\alpha = 0.05$ .
- d. For this part you do not have to show any calculations. How would the type II error  $\beta$  be affected if:
  - i. The type I error  $\alpha$  decreases to 0.01?
  - ii. The true population mean is 129.6 volts?

**EXERCISE 3**

Answer the following questions:

- a. The lifetime of certain batteries are supposed to have a variance of 150 hours<sup>2</sup>. Using  $\alpha = 0.05$  test the following hypothesis  
 $H_0 : \sigma^2 = 150$   
 $H_a : \sigma^2 > 150$   
if the lifetimes of 15 of these batteries (which constitutes a random sample from a normal population) have:

$$\sum_{i=1}^{15} x_i = 250, \quad \sum_{i=1}^{15} x_i^2 = 8000.$$

where  $X$  denotes the lifetime of a battery.

- b. A confidence interval is *unbiased* if the expected value of the interval midpoint is equal to the estimated parameter. For example the midpoint of the interval  $\bar{x} \pm z_{\frac{\alpha}{2}} \frac{\sigma}{\sqrt{n}}$  is  $\bar{x}$ , and  $E(\bar{x}) = \mu$ . Now consider the confidence interval for  $\sigma^2$ . Show that the expected value of the midpoint of this confidence interval is not equal to  $\sigma^2$ .

**EXERCISE 4**

Let  $X$  be a uniform random variable on  $(0, \theta)$ . You have exactly one observation from this distribution and you want to test the null hypothesis  $H_0 : \theta = 10$  against the alternative  $H_a : \theta > 10$ , and you want to use significance level  $\alpha = 0.10$ . Two testing procedures are being considered:

Procedure  $G$  rejects  $H_0$  if and only if  $X \geq 9$ .

Procedure  $K$  rejects  $H_0$  if either  $X \geq 9.5$  or if  $X \leq 0.5$ .

- a. Confirm that Procedure  $G$  has a Type I error probability of 0.10.
- b. Confirm that Procedure  $K$  has a Type I error probability of 0.10.
- c. Find the power of Procedure  $G$  when  $\theta = 12$ .
- d. Find the power of Procedure  $K$  when  $\theta = 12$ .

**EXERCISE 5**

Suppose that the length in millimeters of metal fibers produced by a certain process follow the normal distribution with mean  $\mu$  and standard deviation  $\sigma$  (both are unknown). We will test:

$$H_0 : \mu = 5.2$$

$$H_a : \mu \neq 5.2$$

A sample size of  $n = 15$  metal fibers was selected and was found that  $\bar{x} = 5.4$  and  $s = 0.4266$ .

- Approximate the  $p$ -value using only your  $t$  table and use it to test this hypothesis. Assume  $\alpha = 0.05$ .
- Assume now that the population standard deviation is known and it is equal to  $\sigma = 0.4266$ . Compute the power of the test when the actual mean is  $\mu_a = 5.35$  and you can accept  $\alpha = 0.05$ .
- On the previous page draw the two distributions (under  $H_0$  and under  $H_a$ ) and show the Type I error and the Type II error on them.
- Assume now that the hypothesis we are testing is  
 $H_0 : \mu = 5.2$   
 $H_a : \mu > 5.2$   
Determine the sample size needed in order to detect with probability 95% a shift from  $\mu_0 = 5.2$  to  $\mu_a = 5.3$  if you are willing to accept a Type I error  $\alpha = 0.05$ . Assume  $\sigma = 0.4266$ .
